ABSTRACT

Although job rotation (JR) has been considerably tackled by many scholars in the literature, the influence of JR on the employee motivation (EM) has been given less remarkable attention. This study examines the influence of the five components comprising JR (i.e., overall JR, training and capacity development, job design, career development strategy, and company regulations or systems and procedures) on EM in mobile network companies operating in Yemen. It reviews the literature concerning JR with its components, and EM in mobile network companies operating in Yemen. The framework and the hypotheses of the study are postulated to examine empirically the impact of JR on EM. 250 questionnaires were disseminated to individual employees among the four mobile network companies in Yemen and only 205 valid questionnaires were analyzed as the final sample size using both descriptive and inferential statistical analyses.

Obtained results revealed that the five components of JR have positive significant relationships with EM in mobile network companies operating in Yemen. Moreover, the most influential components of JR on the EM is the company regulations (i.e., systems & procedures) followed by the training and capacity development.

Keywords: Job rotation, job design, employee motivation, mobile network companies, Yemen.

1. Introduction

This study reports on a research that was conducted in the Republic of Yemen to examine the influence of job rotation (JR) on employee motivation in mobile network companies. Primary investigation reveals that the number of researches conducted in this field in developing countries is so limited, so this study will contribute to enrich the field of exchanging experience about employee motivation, and specifically, the effect of JR on employee motivation in mobile network companies operating in Yemen.

A significant portion of the published researches existing in the literature has studied the relationship between JR and employee performance or productivity. The majority of these studies found this relationship to be positive. These and other studies significantly focused on the actual performance and productivity of employees as a major criterion for measuring the effect of the overall JR practices. The majority of these studies mainly neglected measuring the influence of JR on employee motivation (Saravani & Abbasi, 2013).

Therefore, this was a reason that initiated the idea for carrying out this study. Hence, in this study, employee motivation is treated as the dependent variable whereas JR with its components is treated as the independent variable. The concept of JR in Yemen is still nascent and adopted only by the minority of organizations in both public and private sectors.

People naturally resist change because it worries them and affects their job security, it also threatens their interests and once management has succeeded in persuading employees of its importance and reassured them on their job security, they become supporters of it and reason for the success of its practices' application. However, at the same time survival and continuity of the security and administrative leadership in the workplace gives the strength to the organizations in which they work and this continuity ensures the sense of belonging and integration in the organization and job loyalty required of workers which leads to high motivation among those working within the organization, and since JR of administrations.

The intention of this study is to review the influence of JR on the employee motivation in mobile network companies operating in Yemen. This study also intends to determine how to better use the five dimensions of JR to improve employee motivation in mobile network companies and whether the JR's five components (i.e., the overall JR, training & capacity development, job design, career development strategy, and company regulations or systems and procedures) are associated with the employee motivation.

Low motivation of employees in Yemeni mobile network companies is related to lack or insufficient adoption of new and different tools and policies such as JR." The problem is to determine the reasons behind low employee motivation in mobile network companies in Yemen which could be resulted by no or inefficient adoption of JR practices, "What is the impact of JR on employee motivation in the mobile network companies operating in Yemen."

The importance of this study arises from focusing on a large and important industry for Yemeni society (i.e., mobile network companies) which is the most type of organizations that adopt JR practices in Yemen in additional to banking sector and airline companies. The study focuses on

JR practices and their effect on employee motivation. The study fills a gap as the researcher did not find any study examining the impact of JR in any type of organizations in Yemen, but instead, found very limited number of studies that were conducted outside Yemen and were focusing on different types of organizations such as relief, health, and security and different dependent variables rather than motivation such as performance level and productivity (Eriksson & Ortega, 2011).

The results of this study will help mobile network companies to know the level of their employees motivation and its association with JR practices. Today's knowledge economy demands investment in the organizational human capital and to create tools and policies that enable employees to excel at their jobs, but it is strongly perceived that this point was neglected in many researches. This study attempts to enrich the knowledge side for specialists, students and researchers in human resource development as it focuses on the most important resource in any company or organization, which is the human element that is the basic of any organization activity which draws, plans, and implements its objectives and gives it its identity among its competitors. Human element is also the element that provides the organization services to its beneficiaries, so modern organizations can't dispatch this element, not only that, but also it may stops its works and reduces its productivity if the human element is not available enough (Johnson, 2005).

This study also could be instrumental for prospective researchers who have interests in finding an empirical study about JR in Yemen from one side and about the impact that JR could have on the employee motivation of different mobile network companies operating in a unique developing country like Yemen from the other side. It is almost clear that the area of JR in Yemen is still less researched and discussed for many economic and administrative reasons. That is why it is hoped that by presenting this study in such environment with stressing on academic outcomes, prospective researchers would have the opportunity to build their researches on the expected empirical outcomes obtained from this study which emphasize the positive and essential roles of JR on enhancing and developing the Yemeni organizations and employees at large in future.

Furthermore, the researcher also hopes this study will contribute in increasing students and researchers' scientific knowledge in the mobile network field and hopes to be a good start and base for more deep, and comprehensive studies either for the researcher or for others in the future. The study is also very important for human resource management as it helps organizations to attract, retain, and maintain high quality employees. Problems and obstacles that affect the JR's implementation will be determined, this will help organizations in enhancing strength and decreasing system negative aspects, and as a result, increase employees' motivation. In addition, this study provides some evidences in explaining the relationship between JR and employee motivation. The results of this research can be used by students and researchers to develop a plan and integrate a perception about employee motivation to solve problems. The results of this research can also assist mobile network companies to improve employee

motivation by focusing on JR practices (i.e., training & capacity development, job design, career development strategy, and company regulations or systems & procedures).

As this study is an attempt to explore the impact of JR on employee motivation in mobile network companies operating in Yemen, it provides guidance to executives in other different sectors in Yemen, and who wish to improve the efficiency, productivity and general performance of their organizations. Employees can also get benefit from the outcomes of this study as it will be used as a reference and starting point to understand the JR practices and their effect on employee motivation in mobile network companies operating in Yemen. The findings of this study should thus be of interest to managers, employees, and researchers as they will provide guidance to managers, and employees in mobile network companies and different for profit companies operating in Yemen, who wish to understand the importance of JR on employees motivation.

The study is limited to two perceptions, namely, job rotation, and employee motivation to investigate if JR has an influence on employee motivation in mobile network companies operating in Yemen. In addition, this study is limited to the employees of the four mobile network companies operating in Yemen – Sana'a centers (i.e., MTN Group–Yemen, Sabafon, Y Telecom Company, and Yemen Mobile Company).

2. Literature Review

Interests of executives today are turned into a vaster vista about JR and its strategic impact on employee motivation. As a result, many researchers have investigated the relationship between JR and employee motivation and a considerable portion of these studies emphasizes the positive relationship between these two concepts. Kaymaz (2010), contends that when organization adopts JR, this results in improving relationship between JR and employee motivation which leads mostly to an overall better employee performance.

1.1 Job Rotation

JR is a very effective tool to empower employees and develop their horizons. JR is considered the most significant effective element mediated by job satisfaction and skills' diversity on employees' performance and organizations' effectiveness (Saravani & Abbasi, 2013). JR have existed as a method of training for developing individual knowledge, skills, and abilities since the industrial revolution, and in today's dynamic global workplace, JR afford organizations an opportunity to manage changing psychological work contracts and employee desires for self-managed careers. Nowadays, optimal performance of organizations requires human resource development policies. Since human resources are considered as the most valuable factor of production, the most important capital and a major source of competitive advantage, and essential competencies of organizations. Thus, the most effective mean to achieve competitive advantages in the current environment is to improve efficiency of employees. JR is the most important approach of job design as well as human capital development policies which has the potential to improve job performance and increase capabilities of employees. Thus, this study attempts to examine the effects of JR on the motivation of employees in business organizations in Yemen, and especially in mobile network companies, considering the skills' diversity and job

performance and providing effective guidelines to enable managers to lead the organizations toward a better future by using desired policies and approaches such as JR (Marshall, 2006).

Studies on JR and its impact on employee motivation, performance, and productivity differ based on researchers and their directions and diversity. There are several studies addressed JR from different angles and perspectives. JR is used by managements of organizations to rotate human resources in sequence of related tasks of their current posts. It is used to decrease the boredom and increase the motivation of employees by enhancing their competition and improving their performance level. JR is also known as job mobility, but usually, horizontal mobility is termed as JR, while vertical job mobility is termed as promotion. JR is important to develop employees' knowledge, skills, and abilities' level for the current job. It is a tool to reduce the work load. It also brings promotion and acts as a catalyst for carrier development (Kaymaz, 2010 & Holle, 2005).

JR involves an employee changing positions within the same organization and eventually returning to the original position. The term JR can refer to different types of rotations. Task rotation usually takes place in jobs that involve a high degree of physical demands on the body or a high degree of repetitive tasks that can become extremely tedious. Employees are periodically removed from these physically demanding or mentally stressful tasks to a less demanding task for a certain period of time to give them a break (Mourdoukoutas, 2009).

Position rotation is the process of moving an employee laterally to different departments, positions, or geographic locations for the purpose of professional development of the employees by exposing them to new knowledge, skills, and perspectives. Position rotation can be further broken down into within-function rotation, and cross-functional rotation. Within-function rotation is where an employee rotates between jobs within the same level of responsibility and in the same functional or operational areas. Conversely, cross-functional rotation, on the other hand, usually involves a sequence of positions, often with increasing levels of job responsibilities (Marshall, 2006).

There are both, positive and negative effects involved with JR that need to be taken into consideration when an organization makes the decision to use this tool. Reduces the risk of conspiracy between employees in organizations dealing with sensitive information or financial systems such as banks, where there is an opportunity for roguery for personal gains, JR can benefit. In addition, JR replenishes in rare specializations' skills and helps in business continuity as multiple people are equally qualified to perform job tasks. JR also contributes in changing the negative directions of employees as well as discovering their hobbies, and if an employee is unavailable, another can hold his/her position and performs his/her duties with similar efficiency. On contrary, and as mentioned by Azzam (2013), there are many cons of JR such as declining employees' performance due to rotating them to lower-level jobs, bearing many departments the burdens of the incompetent workers, the possibility of exploiting JR method to harm the employee, and influencing the principle of specialization. Furthermore, JR may cause workers to feel job instability and contributes to reduce the power and authority of directors on employees.

In addition, JR may cause many workers to feel frustrated as a result of moving them into other departments that require more effort.

Bhadury and Radovilsky (2006) discussed a number of JR obstacles as well. Among these obstacles and most importantly, regulations and legislations that are not conducive to JR, lack of awareness of the importance of JR to the process of career development, weakness of development department in many organizations humanly, and financially, inappropriate choice for managers, lack of an effective management information system, workers' resistance to change, and lack of financial incentives.

2.2. Job Rotation Theories

As Campion *et al.*, (1994) states, the literature often refers to JR as an important and useful policy, but very few scholars have conducted a detailed studies on its costs and benefits. Nonetheless, there are three theories in JR discussions. There are three potential interpretations for the reasons of adopting JR tool by many organizations. For some people, JR is a kind of training (i.e., an on the job training) or as many authors name it —employee learning; for others, it is a method to reveal and clarify which jobs different employees are best at (i.e., employer learning); and for the third and last group of people, JR is a main motivation mean (i.e., employee motivation) (Eriksson & Ortega, 2011).

2.3. Job Rotation Initiatives in Yemen

JR is one of job design approaches widely used by many organizations and at various hierarchical levels. By adopting the human structure of the company with technical processes, JR is the series of efforts and determination. In Yemen it can be confirmed that companies with a majority of foreign capital which have quite well applied and adopted this policy. In 2009 JR law number 31 was issues by the president of Yemen at that time, the law contains 28 articles distributed into six chapters and the last article of this law was about applying the law from the date of its issuance and publishing it in the official newspaper. Before 2009, JR was not familiar in Yemeni organizations, but even though, it was applied in some of them but randomly and not governed by the laws and regulations. This law was issued for many purposes and to achieve several objectives of Yemeni governmental organizations, such as, improving performance, enhancing competition, assisting employees and managements to overcome boredom and resistance to change, exchanging titles and places of work as a response to work requirements demonstrated by performance appraisal results, enabling organizations to continually conduct training and qualifying for their employees, providing employees with new knowledge, skills, and abilities for their current and future career development, increasing employees' motivation, innovation and creativity, enhancing transparency and fighting corruption, standing ready to cope with any urgent conditions, and embodying the principle of justice, equity, fair and impartial administration (National Information Center, 2014).

The level of JR in Yemen employment system is still very low and its application is still limited to specific industries, such as mobile network operators—which is our field of the current study, banking sector, airline companies, and governmental organizations such as military institutions, judicial institutions, and embassies & diplomatic institutions. And that's why Yemeni economy

lacks the necessary support and supplements needed for lifetime employment, seniority wages, and enterprise unionism. When market conditions and employment requirements change, business companies in Yemen rarely and hardly rotate their core employees from one occupation to another, or from one department to another to meet changing conditions (National Information Center, 2014).

2.4. Employee Motivation

Understanding exactly what motivation is will help managers decide what actions to take to encourage their employees. Motivation is very important for improving employees' performance, productivity, and for job satisfaction. Nowadays, successful business organizations are using many tools and policies that help to motivate employees such as training & development, orientation & placement, transfer & promotion, improving remuneration, compensation, and reward system, and JR adoption (Paswan *et al.*, 2005).

The term motivation was gotten from the Latin root which means Stimulate. Motivation is a conduct; it is not a thing or exceptional occasion that can be watched straightforwardly. It is a compound which depicts particular practices. Two parts of the behavior have been portrayed by the concept motivation. They are to support the behavior or motivation behind a behavior, and appropriate consuming energy. In other words, when behavior is propelled to get a specific purpose, or when seriousness and occurrence level of vitality is not the same as past circumstance. Consequently, the term motivation alludes to two different issues. Initially, what does make a man activate? At that point, what does dominate a form of some activities to the others? (Pakdel, 2013).

Employee motivation has been proven to be a long term success factor in many organizations. Motivating employees is vital to any business. A motivated workforce means a highly productive staff, all of which will help any organization to achieve its business goals. And this should be a main objective in any organizational and business plan. Before organizations build a motivational strategy, the first step needs to be taken is to understand what motivates organization employees. What drives them to their peak performance will better help the organization develops programs that both motivate and retain the best employees for its business (Pakdel, 2013).

There are two kinds of motivation, Extrinsic motivation and Intrinsic and in many studies and researches, it was concluded that organization that satisfies both extrinsic and intrinsic factor of workers gets the best out of them. It is important to understand that people are not all the same; thus effectively motivating employees requires management to gain an understanding of the different types of motivation. Such an understanding will enable the organization's management to better categorize its team members and apply the appropriate type of motivation. It will be clearly noticed that each member is different and each member's motivational needs will be varied as well. Some people respond best to intrinsic which means "from within" and will meet any obligation of an area of their passion. Conversely, others will respond better to extrinsic motivation which, in their world, provides that difficult tasks can be dealt with provided there is

a reward upon completion of that task. To become experts in determining which type of motivation will work best with which team members (Stringer *et al.*, 2011).

2.5. Historical Background of Motivation

The idea of motivation was derived from ancient Greeks, Socrates, Plato, and Aristotle ages. Plato had faith in a hierarchy organized such as dietary component, the rational and the emotional. For more than twenty years, Aristotle kept on attesting the hierarchy spiritual. Nonetheless, he utilized diverse changes which were not quite the same as his original belief. He put stock in those emotional and dietary parts are applicable to body and part of concept of motivation. They can set up some sensors like physical comfort (food), growth, and some sensory (i.e., emotional) experiences such as pleasure and pain. These two factors together were basis of silly motivation power. The rationale area was including all logical aspects of soul such as intellectual concept and some deliberate features. The ancient Greeks assumed three segments or components pains (senses and efforts of will and spirit), pleasures, and the body's desires in a hierarchical arrangement for the first hypothetical justification of the motivational activities (Paswan *et al.*, 2005).

Lately, and in the modern age after the Renaissance, René Descartes compares between active and inactive motivation parts. While will is active element of motivation, Descartes believed that body is inactive element of motivation. Body has a mechanical and physical nature with food desires that answers to those desires by senses and physiological reflects to external environment. The mind has moral, rational, and ideological nature which has determination will. Therefore will is always a force of motivation (Pakdel, 2013).

2.6. Motivation Theories

According to Wheeler and Buckley (2001), there are many competing theories which aim to explain employee motivation. The most popular are five categories of employee motivation, they are: employee motivation need theories which profile the motivational needs for the theorists Maslow (1943) and McClelland (1961), employee motivation equity theories which explain the theories of Adams (1963), based off of prior work by Festinger (1957), employee motivation expectancy theories developed by Vroom (1964), expanded by Hackman and Porter (1968), and further extension of expectancy theory by Porter and Lawler (1968), and task & goal employee motivation theories developed by Herzberg (1959), Locke and Latham (2002) based from prior work of Ryan (1970), Reynolds (2002) derived from Rosenthal and Jacobson (1968), followed by Hackman and Oldham (1968), and concluding with McGregor (1960).

2.7. Relationship between JR and Employee Motivation

JR is seen as a kind of an on-the-job training technique and such training technique is known to have a positive effect on employee motivation (Mohsen *et al.*, 2012). To motivate employees through the use of JR method, the first condition is to ensure that JR practices generate the expected positive effect on employee motivation. From this angle, preparing the employee for management, decreasing monotony and boredom, and increasing the level of knowledge, skills, abilities, and competencies are the functions will be used to achieve the said motivational effect.

The results of Azzam's research study (2013) supported the theory that JR practices has a positive impact on morale of employees providing security services in the Palestinian Ministry of Interior in Gaza Strip. And this study agreed with Karadimas and Papastamuteiou study, (2007) as both studies recommended using JR as an opportunity for organizations to enhance their employees' morale and thus increase their motivation. The topic of JR mostly considered in HR literature, has come to be more accepted as an effective and efficient management tool of enhancing employee motivation and improving skills. Although employees moving from one job to another for certain periods of time is based on a simple logic, the value of the employees is considerably high. It is well-known that JR now is one of the major factors which contribute in increasing employees' motivation and as a result, improve organizational performance, and innovation among the organizational level. As the improvement of employees' motivation is a major concern for organizations' management, the introduction of a different policy is often used as a tool to achieve that purpose, but this is sometimes accompanied by several obstacles and challenges; so is the case with JR policy adoption in different business organizations (Johnson, 2005).

According to Mohsen *et al.*, (2012), JR practices have a positive effect on employee motivation. The development of social relations in JR practices, increasing in knowledge, skills, and competencies, and a decrease in monotony were identified as having a positive impact on employee motivation. From this aspect, it was easily concluded that the adoption of JR practices decreases boredom and monotony and moving from one job to another increases employees' morale and as a result, increases their motivation. JR practices in another way increase personal capacities as well. Holding jobs in different unites increases technical and managerial skills, and knowledge. Improving personal background through JR motivates employees and encourages them for continual improvement. Accumulating more knowledge and skills will assist employees to encounter routine problems related to specific jobs, develop usual ways for performing jobs and this helps employees to be more effective and efficient, more productive and thus, more motivated in various working conditions.

2.8. Job Rotation's Dimensions and Facets

According to Azzam (2013), JR is an effective administrative tool, and it is used in many organizations to achieve different goals. This tool maybe used to target either the employee, the job, or both of them together. When JR is used to target the employee for assigning him in an administrative location for the first time, the purpose of this assignment will be to develop his managerial skills, refine experience, and for letting him acquire new skills, and when changing his administrative location, the purpose of this change is to motivate him, get benefits of his abilities, skills, or preparing him for leadership positions, and higher job responsibilities. However, when JR targets the job itself, this administrative tool will be a source of renewing the organization and contributes in protecting it against sagging and inertia in its performance style, and pushes it toward the best change of its outputs.

According to Allwood and Lee (2004), there is a kind of consensus on the dimensions and requirements of JR process, as many researchers think that there are two main factors determine

whether or not JR is used, these two factors are training & development, and also career development strategy. Many other researchers focused on other factors and requirements of JR such as, company regulations (i.e., system & procedures) used by the organization, and job design. Accordingly, this study will address a number of dimensions and requirements of JR (i.e., training & capacity development, job design, career development strategy, and company regulations or systems & procedures).

2.8.1. Training & Capacity Development

According to Laing (2009), training can achieve the following:

- i. High motivation and morale as employees who are getting the training will have increased confidence and greater motivation to work.
- ii. Lower the production cost, as the training removes the risk and trained employees are able to make better use of materials and equipment, thus reducing avoid wastage.
- iii. Lower turnover rate as training brings a feeling of security in the workplace, which reduces the rate of labor turnover and absenteeism from work.
- iv. Change management as training helps in managing change through increased understanding and involvement of staff in the change process, it also provides the skills and abilities necessary to adapt to new situations.
- v. Causes a sense of personal satisfaction and achievement, and expand opportunities for career development.
- vi. Helps to improve the quality and availability of employees.

Therefore, training is an essential element to improve organizational performance, but also increases the level of individual and organizational competencies. It helps to reconcile the gap between what should happen and what is really happening according to the goals or required criteria and actual performance levels of work. And despite the fact that many employers still have reservations about the cost and size of the financial business returns from training, the skills development is a key factor in sharpening the competitiveness of the organization.

Managers can choose different methods for the development of the job, one of these methods is known as JR, which is the name of the process of transferring a person from one job to another job and it is used widely as a method of development. And JR promotes as one of training methods, a greater understanding of the organization, and make individuals more versatile, and works to enhance their skills, and reduce boredom. And through horizontal transfers, JR may help to revive the enthusiasm and talent development of the employees. The drawback that taints JR process is that it can be expensive because a great deal of time is required to define the trainees with various tasks and new technologies in each unit (Hoyle, 2009).

According to Saravani and Abbasi, (2013), JR is the most important training method where the worker is appended or employed with a number of different jobs in the organization for short or long periods in order to enable him to be familiar with the objects of the enterprise' activity and knowledge of work performance ways in different departments and at the level of different administrations, and thus provides an opportunity to increase the employee's apprentice and good knowledge of other businesses which are related and linked to the original work capabilities.

This method allows greater flexibility in moving the employee to multiple locations in the organization, which can be relied upon in the future or in the near future when faced with problems of working pressure in one department, or in the event of vacancies, or in cases of absence, or resignations, or so on. This method is suitable for the training of presidents, supervisors, or managers, and that the purpose is for qualifying departments' heads or supervisors and others to fill with the highest levels of administrative centers, because the transfer of a person from an administrative site to another is one of the effective means to expand his horizons, improve his experiences, and let him acquires new managerial skills.

2.8.2. Job Design

After completion job analyses and finalizing the job description and reliable specification of good quality, the organization may take advantages of these information so that it reshapes jobs and benefits of these information effectively for structuring elements of the job and tasks in a way that achieves distinctive performance and a very high satisfaction and therefore the job design increases efficiency and productivity and thus reduces the cost. Job design is the process of dividing and arranging activities and work of the organization to groups of jobs and taken into account when designing jobs the set of variables associated with the organization, the employees and the environmental variables. According to Russon and Brown (2008), job design has two main goals:

1. Achieving the regulation requirements for productivity, work efficiency and quality of the product or service.
2. Satisfying individuals' cases of concern, challenge and achievement. And it is clear that these goals are interacting but the general goal of job design is the integration of individual needs with those of the organization.

Hackman and Oldham had developed a model focuses on five important characteristics of job design. As mentioned by Azzam (2013), this model clarifies the importance of job design so as to achieve specific characteristics that lead to motivating employees. This theory has determined five characteristics for job that lead to job satisfaction, motivation, performance improvement and reducing absenteeism and turnover ratios. These characteristics are: Skills Variety, Task Identity, Job Significance, Autonomy, and Feedback. These characteristics if they were estimated in a good way, they may contribute in achieving high work outcomes as they raise the level of employees motivation, and increase performance average as well as record the highest employment satisfaction averages of employees. When these outcomes are achieved, the organization becomes able to compete and achieves its objectives and obtains the best results (Johnson, 2005).

According to Azzam (2013), Job design can have a significant impact on motivation. And JR is one of the most important methods that aims to enhance motivation and increase job satisfaction and performance by gaining a broader understanding and more inclusive of the organization.

According to Bailey (2012), there are three main reasons for the importance of job design, they are:

1. Job design can affect performance in certain jobs, especially those in which the employee motivation can make a big difference in performance.
2. Job design can affect job satisfaction. Because people are more comfortable with the elements of a particular job than others. The low turnover and absenteeism also can be linked to the process of designing an effective job.
3. Job design can affect the physical, mental, psychological, and healthy status of employees alike. The problems that may requires assistance, such as hearing loss, back pain, leg pain, stress, high blood pressure, and even heart diseases in some cases can be attributed directly to the job design.

According to Marshall (2006), one of the things that motivates employees and work to raise their morale according to Herzberg theory is to be working in a job that is characterized by a lot of self-reliance and opportunities for achievements, assume the responsibilities and opportunities for growth. The monotony of job and lack of feeling of its importance cause the employee to feel boring then indifference, means loss of motivation and high-spirit. But the work that needs multiple skills and in which the employee feels he performs a valuable work and can control it, makes the employee enjoys his work and is motivated to improve it. This is the essence of the job design style, which means designing the job in a way that makes it exciting enough for workers, there are several ways to do this including: Job Enlargement, Job Enrichment, Job Simplifying, and Job Rotation.

It is noted that job re-design requires some effort and cost. In the case of job enlargement and JR, it is essential for the workers to be trained to do new tasks. In the case of job enrichment, management needs to enrich the training of personnel to assume greater responsibility and control their work.

Job design can have a significant impact on motivation. One of the methods that are designed to enhance motivation, and thus, enhance job satisfaction, and job performance is JR. This method means transferring workers from one specialized job to another and the goal is to increase interest and motivation of staff and gain a broader and more comprehensive understanding of the organization. Those who worked in JR system were found to have an increase in awareness and willingness to learn and change their outlook towards the general attitude of the new job, as well as to the general framework of the organization. This effect would be doomed to eventual decay if the employee for a long time remained in the job and thus the employee has acquired the fundamental skills needed to perform the new job but lost motivation which accompanied JR, so he has to be entering a new rotation process to make the feeling of motivation and desire to learn permanently exist with employees (Mourdoukoutas, 2009).

2.8.3 Carrier Development Strategy

According to Azzam (2013), contemporary organizations contribute to help employees determine the professional orientation and to identify strengths and weaknesses in their skills and their perceptions of their career goals through the so-called process of career planning and career development. It is the process by which to increase awareness and understanding of individuals of their vocational orientation and professional values and their strengths and weaknesses

through what is provided by the organization of information about job opportunities. The availability of information to the workers about the nature of jobs and positions in the organization helps them to determine their career goals and determine the appropriate methods to achieve these goals.

According to Lazim (2003), there are many positive results that can be achieved through good planning for career development programs including achieve the goals of individuals and organization, reduce the aging of employment, reduce the cost of labor, and improve the reputation of the organization.

According to Holle (2005), there are two main reasons for bringing attention to the career development issues of workers, the first for people and organizations to help them to achieve their goals and expectations, and the second is to enable people and businesses to manage change in the structure of job opportunities, as well as making people aware of the possibilities and steps of education, and the future of learning. The vocational guidance helps to build confidence and empowers individuals. Organizations need to be aware that the positive development of the professional workforce is a way to help attracts the best talents and capacity, and retain employees by identifying their needs and responding to these needs. The guidance will be more effective in helping to develop the knowledge-based economy and achieve benefit both, individuals, employers, and society as a whole. This requires a cultural shift in the behavior of organization management in order to achieve the concept of self-management.

Hoyle (2009), believes that this planning can be on an individual level, or it may be at the corporate level. In planning at the individual level based, organizations plan and develop career paths for their employees, so every employee must plan his future career through insight hopes for the future and to identify the current capabilities and skills, treating differences, knowing solutions, and these steps depend on the insight and candor subjectivity of the individual, building and planning his own future and shows the way to it, and to insist on the passage step by step from the current situation to hoped future. The planning at the corporate level, the vocational and professional preoccupation of each job separately makes it difficult to direct all jobs of human resource management for serving job planning in particular, so it is better for each organization to make independent efforts through the systems, procedures, and regulations that sponsor job planning and development affairs, so the organization will be able to know ambitious competencies of its employees, and plan for their progress and job development.

Bond (2011) sees that planning and career development means are rehabilitation challenging tasks and the involvement of executive managers in career path practices, transfer, and promotion is obligatory. The most important of these means is JR, which means exposing new employee for multiple work experiences and temporarily transfer him from one job to another, and this helps to recognize the other employees, their activities and practical and social work environment, and helps later in performing work with different actors where the employee will know with whom to connect, in which way, which information to take, and perhaps from where to get it. The rule here is to provide all employees with full information about everything related to the good performance of their jobs. Most of the studies on the relations between JR and

planning & career development for employees' career path in organizations has shown the importance of the experience gained through JR process. The multiple entrances to the process of career development are formal training, evaluation, transfer, promotion, and reduce the level of authority, responsibility, and personal relationships.

JR facilitates the transfer of individuals from business or department to another if needed to achieve balance in the job structure as a whole (Lazim, 2003).

2.8.4 Company Regulations (Systems and Procedures)

Managers play critical role in managing employees and urging them on creativity in products and services provided by the organization. Companies that invest regularly in building its strategic procedures and developing mental skills of its employees have more capacities on learning that support change and creativity. There are two systems of human resource management practices, innovative system, and traditional system and they are the only utilized systems till now, primarily for understanding employees' productivity (Azzam, 2013).

3. Methodology

The primary objective of this study is to investigate the influence of JR practices focusing on training and capacity development, job design, career development strategy, and company regulations (i.e., systems and procedures) on employee motivation in mobile network companies in Yemen. The main primary data source is obtained through using a quantitative method by distributing questionnaires among the sample's elements concerned with this study. According to Kothari (2004), in the empirical research, the researcher should first provide operational hypotheses and estimate the probable results then this researcher should strive to have enough data to prove or disprove these hypotheses.

Accordingly, this study has developed five main hypotheses which can be listed as follows:

Hypothesis 1 (H1): There is a significant positive relationship between the overall JR and employee motivation.

Hypothesis 2 (H2): There is a significant positive relationship between training & capacity development and employee motivation.

Hypothesis 3 (H3): There is a significant positive relationship between job design and employee motivation.

Hypothesis 4 (H4): There is a significant positive relationship between career development strategy and employee motivation.

Hypothesis 5 (H5): There is a significant positive relationship between company regulations (i.e., system & procedures) and employee motivation.

3.1. Sample

For the purposes of this study, the sample was selected from the four mobile network companies, (i.e., Sabafon, MTN Group-Yemen, Yemen Mobile, and Y Telecom Company). The criteria of the individual employees selection are based on the following: (i) top or middle-level management employees who are familiar with JR practices such as, executives, managers, and

heads of departments; and (ii) lower-level employees who are not holding positions that qualify them for JR were excluded such as, receptionists, clerks, drivers, guards, and cleaners.

Since the population of the study form a homogeneous group, the simple random sampling (SRS) is the technique used for generating the sample. Individual employees are randomly selected from the targeted population in the four companies.

3.2. Data Collection

This quantitative study uses a questionnaire as the instrument to measure its different variables. Hence, the process of data collection is made through primary available resources in the study's location. The instrument's items concerning the job rotation (JR)—represented by the five independent variables—are adopted from the survey prepared by the Arabic researcher Azzam (2013) that measures JR practices. Moreover, the items of the instrument related to the dependent variable (i.e., employee motivation) are adopted from the survey prepared by Johnson (2005) that measures employee motivation. Instruments with their items from those two sources are used as references and are adapted and abridged whenever applicable to fit the proposed theoretical framework of this study. Nearly 250 questionnaires were distributed personally among the respondents in the top- and middle-level management in the four mobile network companies operating in Yemen. Approximately, 205 valid questionnaires (i.e., 82 percent of the total disseminated questionnaires) were gradually collected back and then prepared for the analyses process.

3.3. Questionnaire Design

In this study, the survey method was used by asking respondents close-ended questions included in a questionnaire. The questionnaire consists of three principal sections as shown in Table 1. These sections are: (i) demographic information; (ii) job rotation (JR); and (iii) employee motivation.

Table 1: Principal Sections of the Study's Questionnaire

Section Name	Description	Number of Items
Section 1	Demographic information	4
Section 2	Job rotation (JR)	22
Section 3	Employee motivation	9

'Section 1' of the questionnaire has the information concerning the demographic values for the respondents. These values include the respondent's gender, age group, educational level (i.e., qualification), and tenure (i.e., years of service). Items (i.e., questions) related to the second and third sections of the questionnaire concerning JR and employee motivation use five-point-Likert-type responses that give the range of 1 = strongly disagree, 2 = disagree, 3 = quietly agree, 4 = agree, and 5 = strongly agree.

4. Finding

Collected data of this study were analyzed with descriptive and inferential statistical analyses using the program SPSS (i.e., Statistical Package for the Social Science) version 20.0 of Microsoft Windows. The items and other demographic variables of the collected questionnaire were coded before they were keyed in the SPSS program. Then, factor analyses for the 22 items of the JR and 9 items of the employee motivation were conducted to obtain KMO (i.e., Kaiser-Mayer-Olkin) values. After that, the reliability analyses was conducted for obtaining the results

of Cronbach's alpha coefficient (α) for each independent and dependent variable included in the questionnaire to determine the consistency of the study's instrument. Furthermore, frequency analyses were conducted concerning the demographic information collected from the respondents such as gender, age, level of education (i.e., qualification), and tenure (i.e., years of service). Subsequently, correlation analyses—depending on the values of the Pearson's coefficient (r)—was utilized to test the relationship between independent variables (i.e., training and capacity development, job design, career development strategy, and company regulations or systems & procedures) and dependent variable, namely, employee motivation, and to determine the type and magnitude of these relationships. In addition, linear multiple regression analyses was used for determining the most influential independent variable or variables on the dependent variable and in determining which are the main predictors among JR dimensions for the employee motivation as the dependent variable of this study.

Table 2: Analyses of the Distributed Questionnaires

Location of Distribution	Questionnaires				
	Distributed	Returned	Discarded	Valid	Valid Rate
MTN – Yemen	75	68	5	63	84%
Sabafon	65	60	3	57	87.7%
Y Telecom	55	49	4	45	81.8%
Yemen Mobile	55	45	5	40	72.7%
Total	250	222	17	205	82%

Table 3: Frequency Distribution

#	Frequency Distribution	Item	Frequency	Percentage (%)
1	Gender	Female	24	11.7
		Male	181	88.3
2	Age	From 20 – 29 years	76	37.1
		From 30 – 39 years	112	54.6
		From 40 – 49 years	16	7.8
		From 50 – 59 years	1	.5
		Above 60 years	-	-
3	Level of Education	Secondary School	25	12.2
		Bachelor Degree	140	68.3
		Master Degree	27	13.2
		Doctoral Degree	-	-
		Others	13	6.3
4	Tenure	From 1-3 years	19	9.3
		From 3-6 years	54	26.3
		7 years and above	111	54.1
		Others	21	10.2

Table 4: Descriptive Statistics

	N	Mean	Std. Deviation
JR_OA	205	3.14	.694
JR_TCD	205	3.09	.848
JR_JD	205	3.11	.818
JR_CDS	205	3.43	.866
JR_CR	205	2.88	.833
EM	205	3.05	.833

Table 4. Shows the descriptive statistical results of the main study's variables (i.e., employee motivation and the five components of JR). Through examining the results shown in this table, it is inferred that the respondents generally expressed that they were quietly satisfied about their motivation level in their companies (Mean = 3.05, S.D = .833). All in all, these respondents also expressed that they were quietly concerned about the overall JR adoption in their companies (Mean = 3.14, S.D = .694), training and capacity development (Mean = 3.09, S.D = .848), job design (Mean = 3.11, S.D = .818), and company regulations (i.e., systems & procedures) (Mean = 2.88, S.D = .833). Alternatively, the respondents expressed that they were dissatisfied with career development strategy of their respective companies (Mean = 3.43, S.D = .866).

Table 5: Reliability Analyses of the Study's Instruments

Description of Variable	Number of Items	Cronbach's Alpha Coefficient(α)
Dependent variable		
Employee Motivation (EM)	9	.878
Independent variable		
Training and Capacity Development (TCD_JR)	5	.804
Job Design (JD_JR)	6	.849
Carrier Development Strategy (CDS_JR)	6	.848
Company Regulations (CR_JR)	5	.852

Based on the outputs of the reliability analyses, all scales used in this study are steadily and internally consistent. These results obtained from performing the reliability analyses are shown in Table 5.

This table shows the Cronbach's alpha reliability coefficients of the independent and dependent variables and all these values are over than .70 range. Hence and based on the obtained results, the internal consistency reliability of the measure used in this study can be considered good and acceptable. Consequently, the result indicates that the Cronbach's alpha coefficient (α) for the nine items related to employee motivation measure is .878 which indicate a good reliability's value. Other values for Cronbach's alpha coefficient concerned with the independent variable (i.e., training and capacity development, job design, career development strategy, and company regulations or systems & procedures) are considered also good. The Cronbach's alpha coefficient (α) for the independent variable known as training and capacity development, shown in Table 6. is .804 which is considered a good value for measuring the consistency of the items comprising this variable. Other values for other independent variables are job design with α =.849, career development strategy with α =.848, are also good, and the value of α = .852 for company regulations which represents the highest value among all other values obtained in this study.

4. Results and Discussion

The correlation matrix shown in Table 7. describes the correlations between employee motivation as the dependent variable and the JR's dimensions, known as the independent variables, which are the overall JR, training and capacity development, job design, career development strategy, and company regulations (i.e., systems and procedures). According to Sekaran (2003), if the correlation is closer to 1.0, the relationship between variables is considered very significant positively and if it is closer to -1.0, the relationship is very significant negatively. There are several Pearson's correlation scales which translate the relationship

between different variables. This study adopts the scale of Pearson's Correlation Coefficient (r) suggested by Cohen (1988) shown in Table 8. to identify the nature of the relationships between dependent and independent variables and their levels of significance.

Table 7: Bivariate Correlation Test for Dependent and Independent Variables

Description of Variables	EM	JR OA	JR TCD	JR JD	JR CDS	JR CR
Employee Motivation (EM)	-	.655**	.522**	.549**	.456**	.653**
Overall JR (JR_OA)		-	.797**	.882**	.830**	.783**
Training & Capacity Development (JR_TCD)			-	.614**	.529**	.524**
Job Design (JR_JD)				-	.653**	.617**
Career Development Strategy (JR_CDS)					-	.490**
Company Regulations (JR_CR)						-

** Correlation is significant at the 0.01 level (2-tailed).

Table 8: Pearson's Correlation Scale according to Cohen (1988)

Value of Pearson's Correlation Coefficient (r)	Indication
Value of $\pm .50$ and over	Strong correlation
Between $\pm .30$ to $\pm .49$	Moderate correlation
Below $\pm .30$	Weak correlation
Value of .00	Negligible correlation

Consequently, the data that were collected, analyzed, and correlated regarding the dependent and independent variables of this study they were eventually used to compare the study's developed hypotheses and the following results were found:

Hypothesis 1 (H1): Overall JR is positively and significantly related to the employee motivation

The relationship between overall JR is tested against the employee motivation. The result indicates that there is a significant relationship between these variables ($r = .655$, $p\text{-value} \leq .05$). Because the value of the Pearson correlation coefficient (r) is .655, the relationship is said to be positive with a strong correlation. Consequently, hypothesis 1 (H1) is accepted.

Hypothesis 2 (H2): Training and capacity development is positively and significantly related to the employee motivation

The relationship between training and capacity development as a dimension of the JR is tested against the employee motivation. The result indicates that there is a significant relationship between these variables ($r = .522$, $p\text{-value} \leq .05$). Because the value of the Pearson correlation coefficient (r) is .522, the relationship is said to be positive with a strong correlation. Consequently, hypothesis 2 (H2) is accepted.

Hypothesis 3 (H3): Job design is positively and significantly related to the employee motivation

The relationship between job design as a dimension of the JR is tested against the employee motivation. The result indicates that there is a significant relationship between these variables ($r = .549$, $p\text{-value} \leq .05$). Because the value of the Pearson correlation coefficient (r) is .549, the relationship is said to be positive with a strong correlation. Consequently, hypothesis 3 (H3) is accepted.

Hypothesis 4 (H4): Career development strategy is positively and significantly related to the employee motivation

The relationship between career development strategy as a dimension of the JR is tested against the employee motivation. The result indicates that there is a significant relationship between these variables ($r = .456$, $p\text{-value} \leq .05$). Because the value of the Pearson correlation coefficient (r) is .456, the relationship is said to be positive with a moderate correlation. Consequently, hypothesis 4 (H4) is accepted.

Hypothesis 5 (H5): Company regulations (i.e., systems & procedures) are positively and significantly related to the employee motivation

The relationship between company regulations (i.e., systems & procedures) as a dimension of the JR is tested against the employee motivation. The result indicates that there is a significant relationship between these variables ($r = .653$, $p\text{-value} \leq .05$). Because the value of the Pearson correlation coefficient (r) is .653, the relationship is said to be positive with a strong correlation. Consequently, hypothesis 5 (H5) is accepted.

Multiple regression analyses was performed by treating separately the dimensions of the independent and dependent variables of this study. Moreover, this analyses was conducted to know more about the most influential dimensions of the independent variable (i.e., JR) on the dependent variable (i.e., EM). The multiple regression analyses shown in Table 9. suggests that the predictors (i.e., training and capacity development, job design, career development strategy, and company regulations or systems & procedures) are significantly and positively related to the criterion known as the employee motivation or the dependent variable.

Table 9: Results of the Multiple Regression Analyses

	Unstandardized Coefficients		Standardized Coefficients		
Model	B	Std. Error	Beta (β)	t	Sig.
(Constant)	.616	.197		3.130	.002
TCD_JR	.174	.066	.178	2.636	.009
JD_JR	.120	.080	.118	1.499	.136
CDS_JR	.059	.066	.061	.889	.375
CR_JR	.458	.067	.457	6.858	.000
F-value	46.981				
R ²	.484				
Adjusted R ²	.474				
Durbin-Watson	1.794				
*p-value < 0.05, **p-value < 0.01					

The results obtained from the regression analyses indicated that the predictor known as company regulations (i.e., systems & procedures) is the most influential independent variable on the dependent variable, namely, employee motivation with a value of .457 for Beta and with a $p\text{-value} \leq .05$ at a 95 % confidence level. Moreover and through examining the β values obtained through the regression analyses, the unstandardized coefficients indicated that company regulations explained 45.8% of the variance in the dependent variable, namely, employee motivation. This means that company regulations (i.e., systems & procedures) in mobile network companies have more effect on employee motivation. This is also a parallel with the previous result obtained in this study which supports the fact that company regulations (i.e., systems & procedures) in mobile network companies are significantly related to employee motivation in the same companies.

Also, the obtained results from the regression model indicated that the predictor known as training and capacity development adopted by mobile network companies has significant influence on the employee motivation of the same companies. The model shows an effective statistical significance for the training and capacity development ($\beta = .178$, $p\text{-value} \leq .05$) at a 95% confidence level. Moreover and through examining the " β " values obtained through the regression analyses, the unstandardized coefficients indicated that the mobile network companies training and capacity development explained 17.4% of the variance in the dependent variable, namely the employee motivation.

Briefly and based on the obtained results from the regression analyses, only two independent variables (i.e., company regulations or systems & procedures, and training & capacity development) are significant predictors for the criterion, namely, the employee motivation. Conversely, other independent variables of JR, namely, job design, and career development strategy are not predictors of employee motivation.

Furthermore, Table 9. of multiple regression shows that the value of R^2 —which identifies the portion of the variance explained by the independent variables of the study—is nearly .484. This means that 48.4 percent of the variance in employee motivation has been significantly expounded by the five components of JR. Besides, this means that there are certainly other components and factors that contribute to employee motivation beside these five components of JR. In addition, Muijs (2004) suggests the rule of thumb for explaining how well the regression model fits the analyzed data. He contends that if: (i) the value of the adjusted $R^2 < 0.1$, then there is a poor fit, (ii) value of adjusted R -square is between 0.11- 0.3, then there is a modest fit, (iii) value of adjusted R -square is between 0.31- 0.5, then there is a moderate fit; and (iv) value of adjusted r -square is > 0.5 , then there is a strong fit. Accordingly, the value of the adjusted R^2 in this study is .474 and this suggests that the predictors of this study are fitting moderately at predicting the criterion, namely, employee motivation.

The Durbin Watson statistical test is also used in this study to detect the level of autocorrelation between errors. The Durbin Watson statistic ranges in value from 0 to 4. As the rule of thumb, a value near 2 for the Durbin-Watson statistics indicates non-autocorrelation, a value towards 0 indicates positive autocorrelation (Ibodullayevna, 2011). Hence, Table 9 suggests that the obtained value from the Durbin-Watson analyses is 1.794 which is a value close to the integer value of 2. This means that the independent variables (i.e., overall JR, training and capacity development, job design, career development strategy, and company regulations or systems & procedures) and dependent variable, namely, employee motivation, are significant and there is a non-value for the autocorrelation.

4.1.Summarizing of the Findings

This study was conducted to measure the influence of JR adopted by mobile network companies on employee motivation in Yemen. The study instrument (i.e., the questionnaire) was disseminated among 250 individual employees in the four mobile network companies in Yemen as the targeted respondents. This questionnaire was adopted from two academic researches in academia then adopted and abridged for the purpose of collecting the following information: (i)

demographic statistical data concerning respondents from the four companies. These demographic data include gender, age of respondents, level of education (i.e., qualification), and tenure (i.e., number of years of service); (ii) the components related to the five categories comprising JR or the independent variable; and (iii) the components related to the employee motivation or the dependent variable.

The five components of the JR were measured with a questionnaire that is used for assessing JR based on an Arabic study for the researcher Ahmed Azmi Ahmed Azzam (2013) which investigates JR on the security leaderships and its reflections on the morale of the employees in the security forces of the Palestinian Ministry of Interior in the Gaza Strip. This 46 item instrument of JR was adapted and abridged by the researcher of this study into 22 items. However, the instrument used to measure the employee motivation was proposed by Johnson (2005) in a research study on employee motivation. The questionnaire items were decreased to 9 items instead of the original 12 items.

Accordingly, the collected entire data through the questionnaire were statistically analyzed—using the software dubbed SPSS Version 20.0—to determine the answer of the main enquiry that this study discusses. This enquiry is about (Does JR with its distinct components has a significant relationship with the employee motivation of mobile network companies in Yemen?). Several hypotheses were postulated to find the answers for the main two research questions of this study. Moreover, the impact of the five components comprising JR on the employee motivation (i.e., the dependent variable) were analyzed to find out the types and significance of these relationships between the independent variables, and the dependent variable. The findings showed that the five components of JR (i.e., overall JR, training and capacity development, job design, career development strategy, and company regulations or systems & procedures) have deferent influences on the dependent variable (i.e., employee motivation).

In this regard, obtained results revealed that there is a significant relationship between JR with its five components and employee motivation in mobile network companies in Yemen. Furthermore, results obtained showed that the most dominant independent variables on the dependent variable were company regulations (i.e., systems & procedures) and followed by training & capacity development in the next rank. However, other components of JR (i.e., job design, and career development strategy) were not predictors of the dependent variable, namely, employee motivation in mobile network companies in Yemen. Table 10. illustrates all the important findings concerning the postulated hypotheses of this study.

Table 10: Results of the Study's Tested Hypotheses

H #	Hypothesis	Outcome
<i>Hypothesis: 1</i>	There is a significant positive relationship between the overall JR and employee motivation in mobile network companies in Yemen.	<i>Accepted</i>
<i>Hypothesis: 2</i>	There is a significant positive relationship between training & capacity development, and employee motivation in mobile network companies in Yemen.	<i>Accepted</i>
<i>Hypothesis: 3</i>	There is a significant positive relationship between job design and employee motivation in mobile network companies in Yemen.	<i>Accepted</i>
<i>Hypothesis: 4</i>	There is a significant positive relationship between career development strategy and employee motivation in mobile network companies in Yemen.	<i>Accepted</i>
<i>Hypothesis: 5</i>	There is a significant positive relationship between company regulations (i.e., systems & procedures) and employee motivation in mobile network companies in Yemen.	<i>Accepted</i>

5. Discussion & Conclusion

The fundamental purpose of this study is to examine the relationship between JR and employee motivation in mobile network companies in Yemen. The study has two research questions. The first question inquires about whether there is a relationship between JR's components adopted by mobile network companies with employee motivation of these companies. The second research question inquires about which are the components of JR that have more influence on employee motivation of these mobile network companies. Briefly, the findings of the data analyses—which are related to the hypotheses and research questions—revealed that the JR's five components have significant relationship with employee motivation (i.e., independent variable) in mobile network companies in Yemen. Furthermore, findings showed that the most dominant independent variable on the dependent variable is company regulations (i.e., systems & procedures) followed by training & capacity development in these companies.

It is also important to refer to the point that the discussions, implications and conclusions in the coming sections will be based on the aggregated obtained results for the whole employees comprising the sample of the study, namely, employees of mobile network companies in Yemen. This means that the discussions will be general to all the employees of companies included in the sample of this study, namely, the 205 elements. This is also done for avoiding any further discussion and implications which would be out of the scope of this study from the theoretical and academic perspectives.

According to Table 10., there is a positive significant relationship between the overall JR and employee motivation in mobile network companies in Yemen. The value of the Pearson correlation coefficient (r) is .655, ($p\text{-value} \leq .05$) which renders the relationship to be a positive strong correlation according to Cohen (1988). Accordingly, the findings from this study justify the fact that if JR adopted by mobile network companies in Yemen is high, then the employee motivation of these companies will be positively improved. The same with other variables as the findings from this study justify the fact that if training and capacity development, job design, career development strategy, and company regulations (i.e. systems & procedures) adopted by mobile network companies in Yemen are high, then the employee motivation of these companies will be positively improved.

Furthermore, and according to table 4., the independent variable company regulations (i.e., systems & procedures) is the most the most influential independent variable on the dependent variable (i.e., employee motivation) and it is the main predictor among JR dimensions for the employee motivation (i.e., the dependent variable) in mobile network companies operating in Yemen followed by training & capacity development whereas, the other two independent variable (i.e., job design and career development strategy) are not good predictors of employee motivation in the same mobile network companies operating in Yemen.

The limitations of this study include having potential personal preferences among respondents who represent their companies concerning the influence of JR with its five components on employee motivation. Another major limitation of this study is the focus on specific industry (i.e., mobile network companies) only main centers of these companies that are operating in

Sana'a City. Other companies for other industries that operate in the Yemeni market could have tangible steps concerning adopting and implementing JR which could explain more the relationship between the variables that this study has discussed. One more significant limitation was the small sample size compared to the large number of employees working in mobile network companies in Yemen. The last significant limitation is the lack of prior researching studies on the JR practices in the body of literature concerning Yemen as a Third World country. The most essential and major recommendation of this study should be directed to the mobile network companies in Yemen. These companies should profoundly review their JR practices and try to relate them more with employee motivation and not caring only about relating JR to the sheer objectives aspects of their employee motivation.

Spending limited time periods in different departments and jobs is something good to be able to see the breadth of the whole company to be organized. Thus developing managerial skills and competencies will be an opportunity to develop the whole company. It is also essential for the heads of relevant departments to support the development of managerial skills and competencies of employees on rotation and for different managers in the company. It is also necessary for departments' heads to closely supervise and monitor employees on rotation and evaluate their performance in the relevant departments. Managers need to prepare an environment for employees which lead to social interaction coupled with exchange of knowledge in an organizational framework to boost staff moral for group activities.

Another major recommendation for mobile network companies is that management must pay specific attention to JR requirements taking in consideration that it is an important variable contributes in affecting employees' motivation. Employees should be subject to adequate training and capacity development as one of the important strategies that help in improving their performance and particularly before rotating them through other jobs in other departments where the training often occurs after JR process.

Subsequently, paying attention by management to the organizational structure and jobs design is very important for jobs to be more visible and strong in the use of developmental practices such as JR. Where planning could be done in an organized and proper way for designing job and identifying the tasks and qualifications needed to be filled as well as helping employees to know rotation and its importance to create their conviction to accept JR through training and change the negative attitudes they have toward it. It is also essential to identify systems and procedures by which they can contribute to the success of JR and work to make them more flexible to accommodate stage variables through a comprehensive and regular review of systems and procedures used in telecommunications companies.

In addition, mobile network companies' managements should attempt to reduce the negatives and expected constraints of JR through good planning and permanent follow-up to rotation, in addition to organized training, and to avoid exploiting JR method for the purpose of harming the employee. For supporting the successful adoption of JR, managements should strive for finding an effective management information system contributes to the implementation of JR well.

One of the future researches suggests exploring more about the potential relationship between entities operating in telecommunication sector and JR practices with its five components. Another future researches is concerned with focusing on conducting a comparative analyses about the level of adopting JR activities in different types of organizations operating in Yemen (i.e., banks, airline companies, and mobile network companies) for having a close look about which type is more successful in adopting this concept and why. As a last suggestion for future researches, studying empirically JR as an independent variable could be done with another dependent variables such as morals, performance, productivity, problem solving skills, job satisfaction, organizational commitment, employee and employer learning, reducing discomfort and boredom, competition and others for having vast and detailed knowledge about the influence that JR could have with each one of those dependent variables.

The current conducted study examined the influence of JR with its five components (i.e., overall JR, training & capacity development, job design, career development strategy and company regulations or systems & procedures) as the independent variable on employee motivation as the dependent variable in mobile network companies operating in Yemen. The study used a quantitative research method in which 205 individual Yemeni and non-Yemeni employees in the targeted four mobile network companies in Yemen operating in the City of Sana'a were surveyed to empirically investigate the assigned hypotheses and research questions contained in this study. The obtained results collected through the 31-question questionnaire revealed that the five components of JR have positive significant relationships with employee motivation in mobile network companies in Yemen.

Among the contributions that this study offers are: (i) tackling objectively the relationship between JR and employee motivation, (ii) clarifying palpably for Yemeni executives, managers, officials and even typical subordinates operating in Yemen that JR—to a considerable extent—is more than only a learning or career development policy; (iii) tackling the concept of JR with its five categories in different Yemeni mobile network companies; and (iv) offering a personal theoretical contribution for a new definition of JR that could be joined to the copious definitions of this concept available in the body of literature. Accordingly, the researcher of this study suggests a definition for JR that could be an object of interest for different researchers and scholars in the academia. This postulated definition can define JR as follows:

JR is the process of organized transition of the employee from one job to another for a specific period of time aiming to let the employee acquires different skills and knowledge to improve his performance, reduce boredom and job combustion, improve his motivation, and solve many other administrative problems through the adoption of JR practices (i.e., training & capacity development, job design, career development strategy, and company regulations or systems & procedures).

Once more and relating to the role of the Yemeni government concerning JR and its adoption by different governmental, for-profit, and nonprofit organizations, the concept of JR in Yemen is still in its primitive stage and needs to be more responsibly considered and discussed in different public and private media and press through the direct support from the Yemeni government

itself. The Yemeni government should have serious steps and procedures for rendering organizations' managements to positively adopt JR and participate effectively in enhancing employees' career development and satisfaction in Yemeni organizations. Losing strength and power as a government in pushing these organizations to seriously practice JR could make them behave irresponsibly and care only about having the maximum portion of available profits, ignoring career development requirements and opportunities of their employees, and doing no more for employees' job satisfaction. The Yemeni government is also required to enact additional and modern laws and regulations that organize and monitor the adoption of JR practices in various types of organizations. To conclude, the concept of JR is vital for all employees, and organizations.

Furthermore, the limitations of this study include having potential personal preferences among respondents who represent their companies concerning the influence of JR with its five components on employee motivation. Another major limitation of this study is the focus on specific industry (i.e., mobile network companies) only main centers of these companies that are operating in Sana'a City. Other companies for other industries that operate in the Yemeni market could have tangible steps concerning adopting and implementing JR which could explain more the relationship between the variables that this study has discussed. One more significant limitation was the small sample size compared to the large number of employees working in mobile network companies in Yemen. The last significant limitation is the lack of prior researching studies on the JR practices in the body of literature concerning Yemen as a Third World country.

One of the future researches suggests exploring more about the potential relationship between entities operating in telecommunication sector and JR practices with its five components. Another future researches is concerned with focusing on conducting a comparative analyses about the level of adopting JR activities in different types of organizations operating in Yemen (i.e., banks, airline companies, and mobile network companies) for having a close look about which type is more successful in adopting this concept and why. As a last suggestion for future researches, studying empirically JR as an independent variable could be done with another dependent variables for having vast and detailed knowledge about the influence that JR could have with each one of those dependent variables.

Ultimately, this study has seriously recommended the mobile network companies in Yemen to considerably review their aspects of JR and activate them and try to relate these activities with the employee motivation. The study also recommended that the Yemeni government should work effectively to formulate well planned JR policies, enact extra and contemporary laws and regulations concerning JR practices at least in governmental institutes, and painstakingly incite all governmental and for-profit entities to seriously adopt JR activities and accordingly contribute in improving the entire workforce career path and job satisfaction.
